

We found it very different to setup the user right management in Windows 2003 Server compared to Windows 2000 server.

What you have to take care is:

1. Don't use the Active Directory user management!
2. Enable the user GUEST (in german GAST). In default setup of Win2003 this user disabled.
3. Enable the user GUEST full access to the shared direcorey "Inkzone" which the inkzonebox reads the files.
